Nexiiva – Business Model

Prepared by Mostafa Adel, founder · October 2026 · For incubator program application

1. Summary

Nexiiva is a process operator training simulator (OTS). Process operators practice startups, upsets and emergency shutdowns on a realistic unit before they touch the real plant. Instructors inject faults, every session is scored automatically, and a certificate is generated after each scenario.

Our first goal is to make operator training simulators available to everyone, individuals and companies, at a price they can afford. Commercial simulators typically cost tens to hundreds of thousands of dollars, so most plants and training centers rely on theory, classroom sessions and on-the-job observation.

Nexiiva is pre-revenue. A CDU/VDU training unit already runs today. OTS Builder, our unit-building platform, is in development and under testing. The plan is a first paid pilot within about three months of company registration.

2. Problem and opportunity

- **No room for error.** Startups, upsets and emergency shutdowns cannot be rehearsed on a live unit without real operational and safety risk.
- **Simulators are out of reach.** Large vendors charge around $110K per unit; specialist simulator firms typically quote $52K–$73K for the configurations we saw.
- **Slow to customize.** Off-the-shelf platforms are built around generic units, not a plant's own P&IDs, tag names or control philosophy.
- **Why now.** From ten years of work across several sites, the founder saw a serious shortage of OTS training systems, mainly because of price. With AI-assisted tooling, a system like this can now be built and offered at a competitive price.

3. Solution and current status

Part	What it does	Status
Nexiiva simulator	DCS-style trainee screens, live process diagrams, alarms and trends; instructor console that mirrors the trainee view, injects faults and scores sessions; automatic certificate	CDU/VDU unit running today
OTS Builder	AI agent (Arabic and English; online through the API, or offline with no AI) that assembles a new unit from a 387-type equipment library and generates a full, ready-to-run training project	In development and under testing
Deployment	Cloud, or on-premises on the client's own servers, including fully offline operation	Designed

Other status points:

- An Arabic demo video exists.
- Accepted into the first stage of the EIP at the Global Entrepreneurship Festival (GEF), Cairo, 6–8 November 2026.
- OTS Builder's target is a complete unit in about one week. This is not yet measured; the second unit will record the real build time.
- Not yet validated on real unit data. Validation is part of every pilot.

4. Customers and market

Segment	Who	How they buy
Plants	Refiners, gas processors and petrochemical producers in Egypt	Paid pilot, then Cloud or on-prem contract per unit
Training centers	Centers that train operators and engineers	Per-person courses on generic or custom units
Individuals	Engineers and operators	Through training-center courses

The deck counts 40–45 target organizations in Egypt, from public listings. A large refinery can run many process units, so the plan is to land with one or two units and expand. Egypt comes first, to build the Nexiiva name before looking elsewhere. The figures are

illustrative, not a forecast.

5. Business model canvas

Block	Nexiiva
Customer segments	Egyptian plants (refining, gas, petrochemicals); training centers; individual engineers through courses
Value propositions	Safe practice of emergencies; instructor tools and automatic scoring and certificates; first-year cost around $5K per unit against $52K–$110K for alternatives; customization to the client's own unit through OTS Builder; Cloud or on-prem, including offline
Channels	Direct outreach to plants and training centers; paid pilots as the entry point; demo video and live demos; events such as GEF; incubator network
Customer relationships	Paid pilot with structured feedback, then a contract; per-unit customization with the client's engineers; scenario packs and trainee reports
Revenue streams	Pilot fee; Cloud and on-prem contracts per unit; annual renewals and support; per-person course fees
Key resources	Working CDU/VDU simulator; OTS Builder and its 387-type equipment library; the founder's ten years in petrochemicals, refining and gas processing; AI tooling (Claude Max and API)
Key activities	Finish and test OTS Builder; build a second unit and record the real build time; run paid pilots and validate on real unit data; develop scenario packs; sell courses
Key partners	Plants that host pilots; training centers; process engineers who review units; the incubator; a cloud hosting provider once the first Cloud customer signs

Block	Nexiiva
Cost structure	Company setup, AI subscriptions for three months, domain and email; per-customer hosting, pilot costs, unit build and expert validation; no founder salary modeled; customers pay travel and hardware

6. Revenue model and pricing

Prices are in USD before VAT. Company contracts get a 30% launch discount in Year 1 only (not on pilots or training centers). Prices are a hypothesis, not based on customer or competitor data, and will be tested with the first customers.

Offer	Price
Pilot (3 months)	$800
Cloud, one time	$1,000 configuration + $1,000 per unit build + $600 training (2 days, 3 hours, 2 people)
Cloud, recurring	$800 per year (up to 8 users) + $10 per trainee hour
On-prem (perpetual), one time	$4,000 per unit build + $1,000 installation per station + $600 training
On-prem, recurring	$500 per station per year from Year 2
Training-center course	$100 per person (generic) or $500 per person (specific unit); 5 days, minimum 5 trainees

First-year value of one customer with one unit, in the model:

- **Cloud:** about $5,180 at launch price ($7,400 at list), assuming 4 trainees and 100 hours each per year.
- **On-prem with 3 stations:** about $5,320 at launch price ($7,600 at list).
- Customers pay travel and hardware.

7. Competitive position

	Large vendors	Specialist simulator firms	Nexiiva
Cost	Around $110K per unit	Typically $52K–$73K for quoted configurations	About $5K per unit in the first year at launch price
Customization	Often longer delivery and vendor support	Tailored to each customer	Faster, more flexible, through OTS Builder
Deployment	Depends on the vendor	Customized per customer	Cloud or on-prem, including offline

8. Financial projections

Three-year model, USD, annual. Net income is after a founder bonus (20% of each sale's profit after its direct costs, counted as an expense) and 22.5% corporate income tax, with losses carried forward.

Base scenario	Year 1	Year 2	Year 3
Revenue	7,380	25,400	44,700
Gross profit	5,270	21,180	36,670
Gross margin	71%	83%	82%
Net income	1,755	13,111	22,715
Cumulative net income	1,755	14,867	37,582

Base assumptions: 2, 4 and 8 pilots; 1, 1 and 2 new Cloud customers; 0, 1 and 1 new on-prem customers; 1, 3 and 5 new training centers; 75% annual retention.

Other scenarios	Year 1	Year 2	Year 3
Pessimistic revenue	800	9,600	16,400
Pessimistic net income	−2,733	5,669	8,557
Optimistic revenue	25,160	61,340	119,080
Optimistic net income	10,210	29,132	56,666

In the pessimistic case Year 1 is a loss and cumulative net income turns positive in Year 2.

Limits. The model shows what the assumptions imply; it does not prove demand. Cash timing is not modeled. Hours of use per trainee and hosting cost per Cloud customer are estimates. Founder time is not costed.

9. Roadmap and milestones

Period	Milestones
Months 0–3	Register the company; build a second unit and record the real build time; finalize the paid-pilot package
Months 3–6	Run the first paid pilot; collect structured feedback; first scenario pack and trainee reports
Months 6–12	Convert pilots into paid contracts; sell per-person courses to training centers; build Nexiiva's name in Egypt first
Years 2–3	Expand within existing customers; add other process industries; grow the scenario library and analytics

10. What it takes to set up the company

These are the material needs to establish the company and reach the first paid pilot. Nothing else is paid before the first customer; there is no hosting cost until a customer exists, and no founder salary is planned.

Need	Amount
Company registration, lawyer and accountant (at setup)	$1,300
Claude and API subscriptions to finish OTS Builder and build the second unit (3 months)	$1,625
Domain and business email	$75
Total	**$3,000**

The registration figure is an estimate from public guides; a quote is pending. Trademark and IP protection, travel and marketing, and hardware are not yet budgeted.

11. How the incubator program helps, and how we benefit

Nexiiva has a working product and a clear plan, but one founder with a technical operations background and no team. The incubator would close these gaps:

Need	How the program helps	What Nexiiva gains
Company setup	Registration, legal and accounting guidance or support; advice on the right tax regime (the model assumes the standard 22.5%)	Faster setup, lower upfront cost, correct structure from day one
First paid pilot	Introductions to plants and training centers among the 40–45 target organizations	A first pilot within about three months, and real unit data to validate the simulator
Technical validation	Access to process engineers and mentors to review units	Credibility with plant customers; the model budgets about $400 per unit for expert review
Pricing and sales	Mentoring on pricing, contracts and sales, since all prices are still untested	Prices based on customer feedback rather than assumptions
Tools and infrastructure	Partner credits for AI/API and cloud hosting where available	Lower running cost while finishing OTS Builder and building the second unit
IP protection	Guidance on trademark and IP, not yet budgeted	Protected brand and product before public launch

Need	How the program helps	What Nexiiva gains
Visibility in Egypt	Demo days, events and networks	The Nexiiva name built in Egypt first
Funding path	Introductions to investors and grants once pilot results exist	A funded step after the first pilots

What the program can expect from Nexiiva: the milestones in section 9, structured pilot feedback shared with mentors, and measured results (real build time for the second unit, pilot outcomes, conversion to paid contracts).

12. Risks and what we still need to prove

- **Fidelity:** the simulator is not yet validated on real unit data; every pilot includes validation.
- **Pricing:** prices are assumptions to test with the first customers.
- **OTS Builder:** it is still in development; the one-week unit target is not yet measured.
- **Demand:** the plan depends on converting pilots into paid contracts; the pessimistic scenario shows a Year 1 loss.
