NEXIIVA

Operator training simulators, available to everyone.

Fewer operator errors. Safer people. Protected profits.

What is Nexiiva?

A simulator where process operators practice startups, upsets and emergency shutdowns before they touch the real plant.

Who is it for?

Refineries, gas and petrochemical plants, training centers, and individual engineers and operators.

How does it help?

Operators rehearse the moments that matter on a safe, realistic unit, so fewer errors reach the real plant. Instructors inject faults and every session is scored automatically.

Why do we exist?

Our first goal is to make operator training simulators available to everyone, individuals and companies, at a price they can afford.

Operators cannot rehearse the moments that matter most

No room for error

Startups, upsets and emergency shutdowns cannot be rehearsed on a live unit without real operational and safety risk.

Simulators are out of reach

Commercial operator training simulators typically cost from tens of thousands to hundreds of thousands of dollars, depending on customization and licensing.

Slow to customize

Off-the-shelf platforms are built around generic units, not a plant’s own P&IDs, tag names or control philosophy.

As a result, much operator training still relies on theory, classroom sessions and on-the-job observation.

Practice, instruct, certify

Practice. DCS-style trainee screens, live process diagrams, alarms and trends.

Instruct. Inject faults, monitor sessions and score performance automatically.

Certify. A certificate with the full scoring breakdown is generated after each scenario.

Live process flow diagram

Instructor console: trainee view mirrored live

12 live trend charts

Certificate generated automatically

OTS Builder: The Jewel of Nexiiva

AI agent. Describe the unit you need in Arabic or English and the agent builds it. AI mode runs online through the API; offline mode needs no AI and no internet.

Equipment library. Assemble a new unit from 387 equipment types.

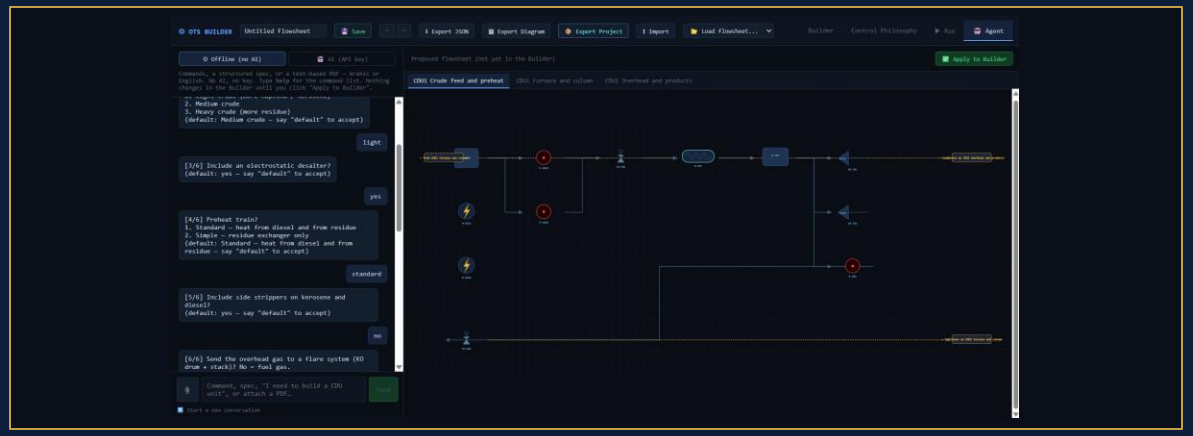

Complete unit. Generates a full training project, ready to run.

Record time. Built to create a unit in record time: target about one week, to be measured on the second unit.

Status. In development and under testing.

387-type equipment library

Builder agent: offline mode (no AI) or AI mode

Why me, and Why now

Why me

- 10 years of experience in petrochemicals, refining and gas processing.
- I worked at the MIDOR refinery and Sanmar petrochemicals in Egypt, the Agiba gas processing plant in the Western Desert, and the Port Harcourt refinery in Nigeria.
- The product is built and tested: a CDU/VDU training unit runs today.

Why now

- Across the sites I worked at, I saw a serious shortage of OTS training systems, mainly because of their high price.
- In the AI era, a system like this can be built and offered at a competitive price, available to individuals and companies alike.

A focused first market with room to expand

40–45

target organizations in Egypt: refiners, gas processors, petrochemical producers and training centers

$4.5–7.6K

first-year value of one unit per customer, from launch to list price

$0.18–0.34M

first-year revenue if each organization starts with one unit

Bottom-up: customers × units × price. Counts are approximate and the figures are illustrative, not a forecast. A large refinery can run many process units, so the plan is to land with one or two and expand. The Gulf and other process industries follow.

Where Nexiiva fits against the alternatives

	Large vendors	Specialist simulator firms	Nexiiva
Cost model	High, Around $110K per unit	Typically $52K–$73K for the quoted configurations	More affordable: from about $4.5K per unit in the first year (launch price)
Customization	Often involves longer delivery times and vendor support	Solutions tailored to each customer's requirements	Faster, more flexible customization using Nexiiva's internal OTS Builder
Deployment	Depends on the vendor's solution	Customized deployment based on customer requirements	Cloud or on-premise (installed on the client's own servers), including offline operation

Nexiiva's advantage: lower entry cost, flexible deployment, and an internal development platform designed to help Nexiiva build customized industrial simulations more efficiently.

Roadmap: from first pilot to repeatable contracts

Months 0–3

- Register the company
- Build a second unit and record the real build time
- Finalize the paid-pilot package

Months 3–6

- Run the first paid pilot
- Collect structured feedback
- First scenario pack and trainee reports

Months 6–12

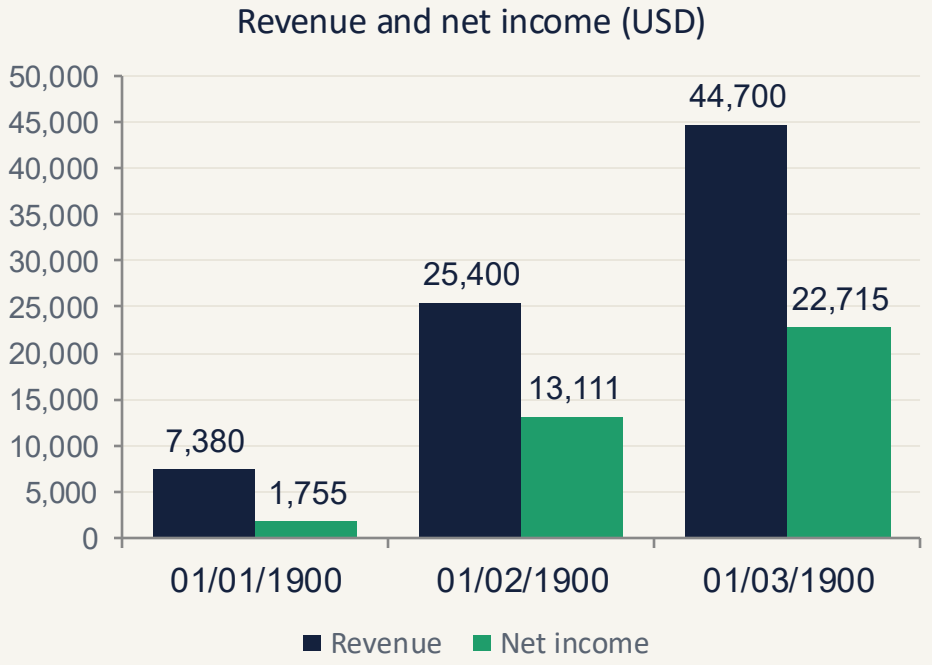

- Convert pilots into paid contracts
- Sell per-person courses to training centers
- Build Nexiiva’s name in Egypt first

Years 2–3

- Expand within existing customers
- Add other process industries

Financial summary

Base scenario, USD	Year 1	Year 2	Year 3
Revenue	7,380	25,400	44,700
Gross profit	5,270	21,180	36,670
Gross margin	71%	83%	82%
Net income (after bonus and tax)	**1,755**	**13,111**	**22,715**
Cumulative net income	**1,755**	**14,867**	**37,582**

Pricing: company contracts at launch prices (30% below list in Year 1), pilot at $800, training-center courses at $100 (Generic) or $500 (Specific) per person. In the pessimistic case, Year 1 shows a net loss of $2,733 and cumulative net income turns positive in Year 2. Nexiiva is pre-revenue; prices and volumes are assumptions to be tested with the first customers.

The ask and how it will be used

$3,000

To set up the company, put the product online with a website and email, and fund the tools to finish OTS Builder and build the second unit, aiming at the first paid pilot within about three months.

Company registration, lawyer and accountant	$1,300
Claude and API subscriptions (3 months)	$1,625
Domain and business email	$75
Total	**$3,000**

The registration figure is an estimate from public guides; a quote is pending.
